1.42 – 1.67 GHz QUASI SUPER CONDUCTOR LOW NOISE AMPLIFIER

Typical Performance

Application Notes:

A. The Noise Figure

The noise figure of 0.30 dB is measured at 21 °C with the input SMA connector, input internal 50V DC block capacitor. Thus, the external input DC block capacitor is not needed. **For additional lower noise figure of 0.10 dB, cool the amplifier to – 40 °C.**

The amplifier shall be mounted directly behind the feed of the telescope antenna to suppress the cable loss between the antenna and the ground receiver. The DC voltage of +5V can be fed through the output cable from the ground receiver (WLA15-3525ABT) only.

B. SMA Torque Wrench Selection

Always use a torque wrench with 5 ~ 6 inch-lb coupling torque setting for mating the SMA cables to the amplifier. Never use torque more than 8 inch-lb wrench for tightening the mating cable to the connector. Otherwise, the permanent damage will occur to the SMA connectors of the amplifier. 8710-1582 (5 lb-Inch) is one of the ideal torque wrench choice from Agilent Technology.

C. Mounting the Amplifier

Use three pieces of #2-56 with longer than 9/16" screws for mounting the amplifier on a metal-based chase. Flat and spring washers are needed to prevent the screw loosening during the shock and vibration.
